

## Exercise 2

The Customer Service Representative sends a Mortgage offer to the customer and waits for a reply. If the customer calls or writes back declining the mortgage, the case details are updated and the work is then archived prior to cancellation. If the customer sends back the completed offer documents and attaches all prerequisite documents then the case is moved to administration for completion. If all pre-requisite documents are not provided a message is generated to the customer requesting outstanding documents. If no answer is received after 2 weeks, the case details are updated prior to archive and cancellation.

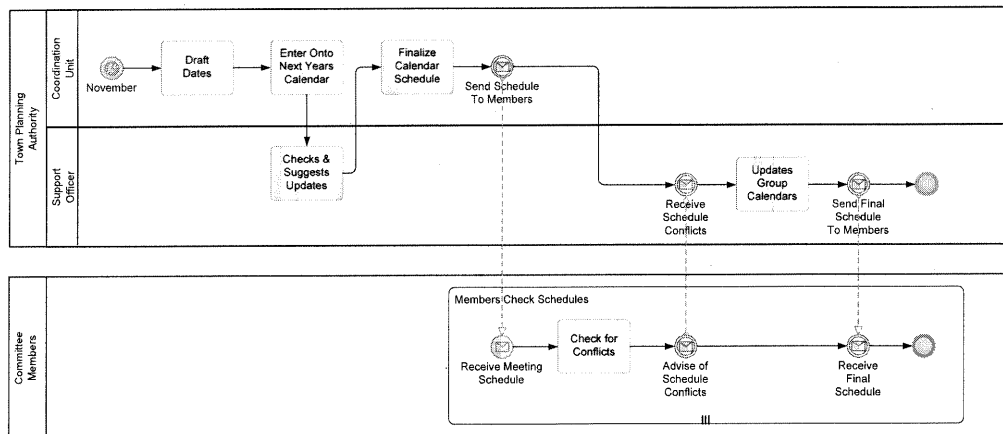

*A straightforward Event-Based Gateway is at the core of this solution.*

### Exercise 3

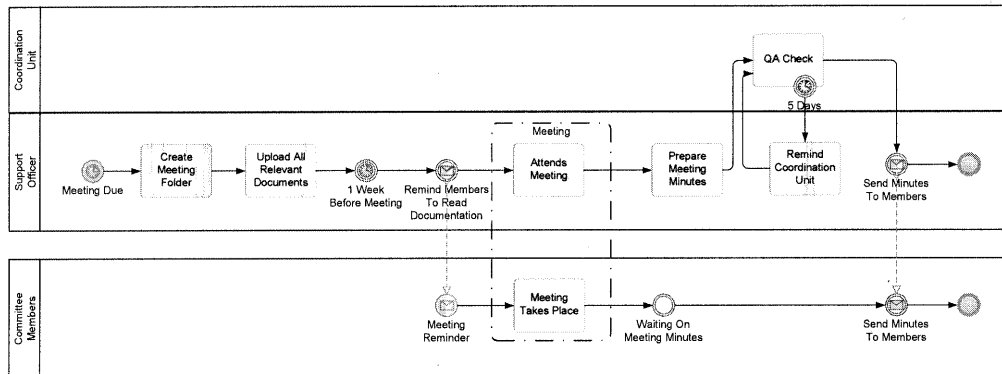

In November of each year, the Coordination Unit at the Town Planning Authority drafts a schedule of meetings for the next calendar year and adds draft dates to all calendars. The Support Officer then checks the dates and suggests modifications. The Coordination Unit then rechecks all dates and looks for potential conflicts. The final schedule of meeting dates is sent to all the independent Committee Members by email, who then check their diaries and advise the Coordination Unit of any conflicts. Once the dates are finalized (by the Coordination Unit), the Support Officer updates all group calendars and creates meeting folders for each meeting and ensures all appropriate documents are uploaded to system. Committee Members are advised a week before each meeting to read all related documents. The Committee Members hold their meeting, and the Support Office then produces minutes including any Action Points for each Committee Member. Within 5 working days, the Coordination Unit must conduct a QA check on the minutes, which are then sent to all Committee Members. The Support Officer then updates all departmental records.

*If the modeler tries to build this as one process it is inordinately difficult, yet if two processes are used, the answer is obvious and relatively simple. Notice the use of Message Flow to communicate between Pools (as the Committee Members work outside of the Town Planning Authority).*

#### Part I – Exercise 3

*Notice that the Meeting is indicated with a Group across the two Pools. We have also used a None Intermediate Event to represent the Committee Members waiting for the Meeting Minutes. Note that this Intermediate Event will not actually wait. It will immediately trigger (pass through) and go to the Message Event, which will do the actual waiting.*

## Part II (Exercise 3)

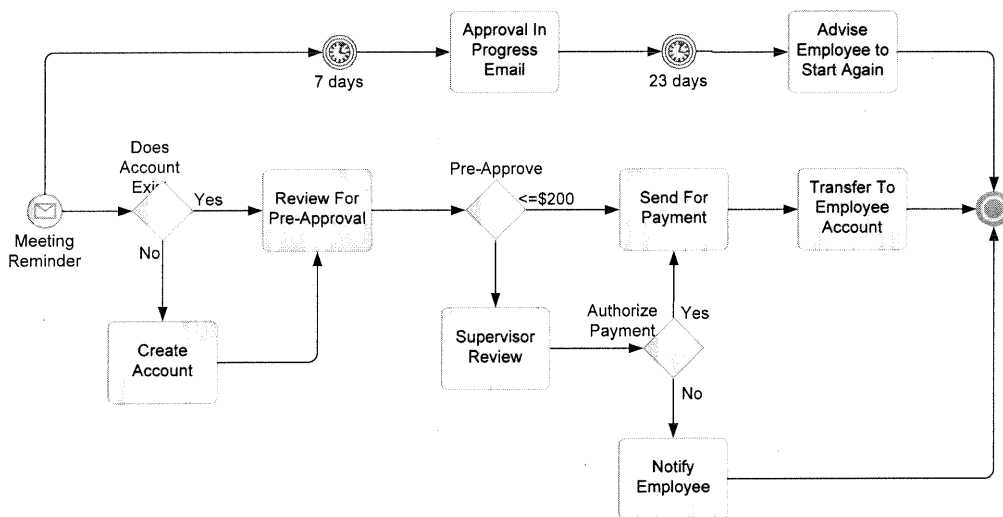

#### Exercise 4

After the Expense Report is received, a new account must be created if the employee does not already have one. The report is then reviewed for automatic approval. Amounts under \$200 are automatically approved, whereas amounts equal to or over \$200 require approval of the supervisor.

In case of rejection, the employee must receive a rejection notice by email. The reimbursement goes to the employee's direct deposit bank account. If the request is not completed in 7 days, then the employee must receive an "approval in progress" email

If the request is not finished within 30 days, then the process is stopped and the employee receives an email cancellation notice and must re-submit the expense report.

*While it is possible to show the Lanes and create an automated system support environment, this answer sticks to the core process model. It uses the parallel Timer Intermediate Event to create a race condition with the main process, which ends with a Terminate End Event to win the race.*

## Exercise 5

After the Process starts, a Task is performed to locate and distribute any relevant existing designs, both electrical and physical. Next, the design of the electrical and physical systems starts in parallel. Any existing or previous Electrical and Physical Designs are inputs to both Activities. Development of either design is interrupted by a successful update of the other design. If interrupted, then all current work is stopped and that design must restart.

In each department (Electrical Design and Physical Design), any existing designs are reviewed, resulting in an Update Plan for their respective designs (i.e. one in Electrical and another in Physical). Using the Update Plan and the existing Draft of the Electrical/Physical Design, a revised design is created. Once completed the revised design is tested. If the design fails the test, then it is sent back to the first Activity (in the department) to review and create a new Update Plan. If the design passes the test, then it tells the other department that they need to restart their work.

When both of the designs have been revised, they are combined and tested. If the combined design fails the test, then they are both sent back to the beginning to initiate another design cycle. If the designs pass the test, then they are deemed complete and are then sent to the manufacturing Process [a separate Process].

*Although it sounds like the above example will never complete, in fact the first Sub-Process to successfully complete will fire the Signal End Event, before progressing to the Merging Parallel Gateway. There it will wait for the other Sub-Process to complete. Meanwhile, the other Sub-Process will restart before moving through to its own Signal End Event. Although the Signal will fire, the other Sub-Process has already completed and is not in a position to "catch" the Signal. When both Sub-Processes have completed successfully, the Parent Process moves to test the combined design before either sending the work back to restart, or end successfully. The link to the separate Manufacturing Process is not shown – it would probably be implemented via a Signal End Event or potentially a Message End Event.*
